1 More Backpropagation

1.1 Backpropagation through a DAG of modules

Defining the vectors $o = (o_{max}, o_{min})$, $x = (x_1, x_2)$ and $\frac{\partial E}{\partial x} = (\frac{\partial E}{\partial x_1}, \frac{\partial E}{\partial x_2})$ the first step in back propagation is:

$$\frac{\partial E}{\partial o} = \frac{\partial E}{\partial y} \frac{\partial y}{\partial o} = \left(\frac{\partial E}{\partial y}, \frac{\partial E}{\partial y} \right)$$

The second step:

$$\frac{\partial E}{\partial i} = \frac{\partial E}{\partial o} \frac{\partial o}{\partial i} = \left(\frac{\partial E}{\partial y}, \frac{\partial E}{\partial y} \right) \begin{bmatrix} \frac{\partial max(i_1, i_2)}{\partial i_1} & \frac{\partial max(i_1, i_2)}{\partial i_2} \\ \frac{\partial min(i_1, i_2)}{\partial i_1} & \frac{\partial min(i_1, i_2)}{\partial i_2} \end{bmatrix} = \left(\frac{\partial E}{\partial y}, \frac{\partial E}{\partial y} \right) \begin{bmatrix} 1 & 0 \\ 0 & 1 \end{bmatrix} = \left(\frac{\partial E}{\partial y}, \frac{\partial E}{\partial y} \right)$$

Finally:

$$\frac{\partial E}{\partial x} = \frac{\partial E}{\partial i} \frac{\partial i}{\partial x} = \left(\frac{\partial E}{\partial y}, \frac{\partial E}{\partial y} \right) \begin{bmatrix} \frac{\partial \sigma_1}{\partial x_1} & \frac{\partial \sigma_1}{\partial x_2} \\ \frac{\partial \sigma_2}{\partial x_1} & \frac{\partial \sigma_2}{\partial x_2} \end{bmatrix} = \left(\frac{\partial E}{\partial y}, \frac{\partial E}{\partial y} \right) \begin{bmatrix} \frac{e^{-x_1}}{(1+e^{-x_1})^2} & 0 \\ 0 & \frac{e^{-x_2}}{(1+e^{-x_2})^2} \end{bmatrix}$$

That is:

$$\begin{aligned} \frac{\partial E}{\partial x_1} &= \frac{\partial E}{\partial y} \frac{e^{-x_1}}{(1+e^{-x_1})^2}, \\ \frac{\partial E}{\partial x_2} &= \frac{\partial E}{\partial y} \frac{e^{-x_2}}{(1+e^{-x_2})^2} \end{aligned}$$

1.2 Batch Normalization

1: Using the chain rule we have:

$$\frac{\partial E}{\partial x_k} = \frac{\partial E}{\partial y_k} \frac{\partial y_k}{\partial x_k} + \frac{\partial E}{\partial E(x_k)} \frac{\partial E(x_k)}{\partial x_k} + \frac{\partial E}{\partial \sigma^2(x_k)} \frac{\partial \sigma^2(x_k)}{\partial x_k} =$$

and so:

$$\frac{\partial E}{\partial x_k} = \frac{\partial E}{\partial y_k} \frac{1}{\sqrt{\sigma^2(x_k)}} + \frac{\partial E}{\partial E(x_k)} \frac{1}{n} + \frac{\partial E}{\partial \sigma^2(x_k)} \frac{2}{n} \sum_{i=1}^n (x_{k_i} - E(x_k)) \quad (1)$$

where we used the definition of $E(x_k)$ and $\sigma(x_k)$ to calculate their derivatives.
And where:

$$\begin{aligned} \frac{\partial E}{\partial E(x_k)} &= \sum_{i=1}^n \frac{\partial E}{\partial y_{k_i}} \frac{\partial y_{k_i}}{\partial E(x_k)} + \frac{\partial E}{\partial \sigma^2(x_k)} \frac{\sigma^2(x_k)}{\partial E(x_k)} = \sum_{i=1}^n \frac{\partial E}{\partial y_{k_i}} \frac{-1}{\sqrt{\sigma^2(x_k)}} + \frac{\partial E}{\partial \sigma^2(x_k)} \left(\frac{-2}{n} \sum_{i=1}^n (x_{k_i} - E(x_k)) \right) \\ \frac{\partial E}{\partial \sigma^2(x_k)} &= \sum_{i=1}^n \frac{\partial E}{\partial y_{k_i}} \frac{\partial y_{k_i}}{\partial \sigma^2(x_k)} = \sum_{i=1}^n \frac{\partial E}{\partial y_{k_i}} \left[-\frac{1}{2\sqrt{(\sigma^2(x_k))^3}} (x_{k_i} - E(x_k)) \right] \end{aligned}$$

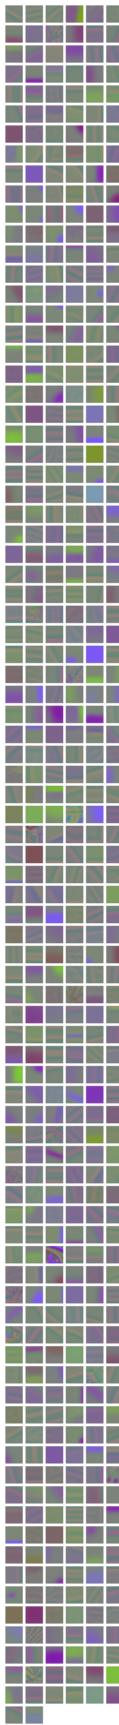

2: Adding a learnable bias we have:

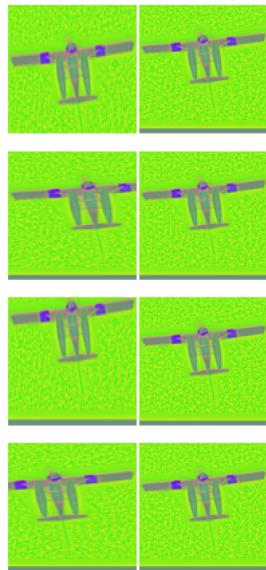

$$y_k = \frac{x_k - E(x_k)}{\sqrt{\sigma^2(x_k)}} + \epsilon$$

The back propagation will be the same of (1). And in addition we have the parameter ϵ for which:

$$\frac{\partial E}{\partial \epsilon} = \sum_{i=0}^n \frac{\partial E}{\partial y_{k_i}} \frac{\partial y_{k_i}}{\partial \epsilon} = \sum_{i=0}^n \frac{\partial E}{\partial y_{k_i}}$$
